How to: Connect to TTUnet VPN on Linux

Notice

The TTU IT Division, in partnership with the Student Government Association (SGA), have provided the following information as a courtesy to the TTU community. The TTU IT Division does not officially endorse or provide support for the product/information below. Please contact the Texas Tech Linux Users Group (LUG) for further assistance.

Details

 заметка: The VPN service will need to be enabled on your account for GlobalProtect to connect. You may request access or verify that VPN is enabled for your account by contacting IT Help Central.

Linux systems are able to connect to TTUnet using the default settings for TTUnet VPN using a package that supports X-auth. If they do not already have a package/client that supports X-auth, they will need to install one. A GlobalProtect client is not needed.
